

# Introduction to Internet #3

**Introduction to Internet and Web** 

### **Table of Contents**

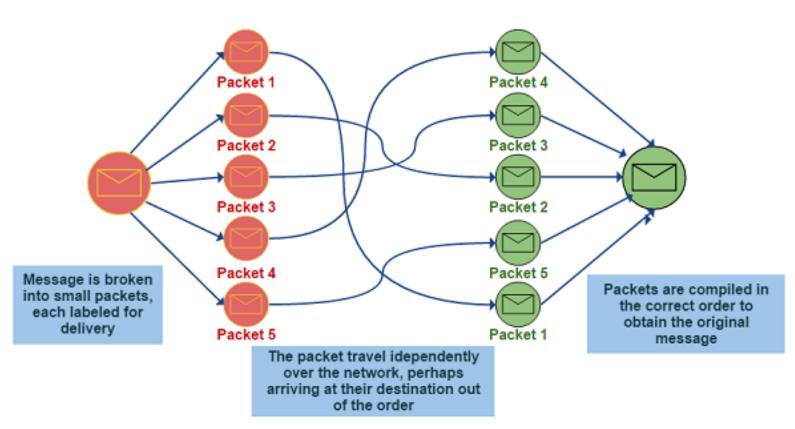

- **❖** Data Delivery in Internet
- **❖** Protocol Stack
- **❖** Transport-Layer Services
- User Datagram Protocol
- Transmission Control Protocol

# oo. DATA DELIVERY IN INTERNET

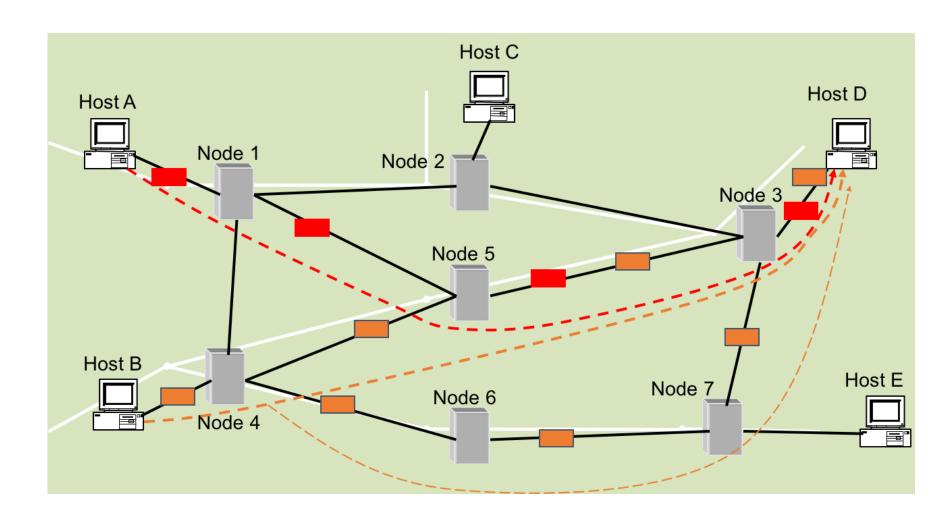

# Message into Datagrams

**Internet Packets Transmission** 

# **Datagram Delivery**

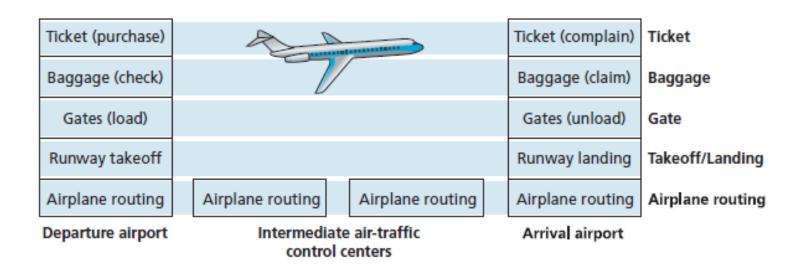

# **01. PROTOCOL STACK**

# **Layering of Airline Travel**

### layers: each layer implements a service

- via its own internal-layer actions
- relying on services provided by layer below

# Why Layering?

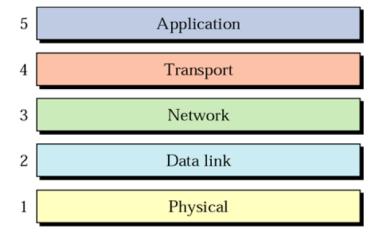

- Explicit structure allows identification, relationship of complex system's pieces
  - layered reference model for discussion

- Modularization eases development, maintenance, and updating of system
  - change of implementation of layer's service transparent to rest of system
  - e.g., change in gate procedure doesn't affect rest of system
- Layering considered harmful?

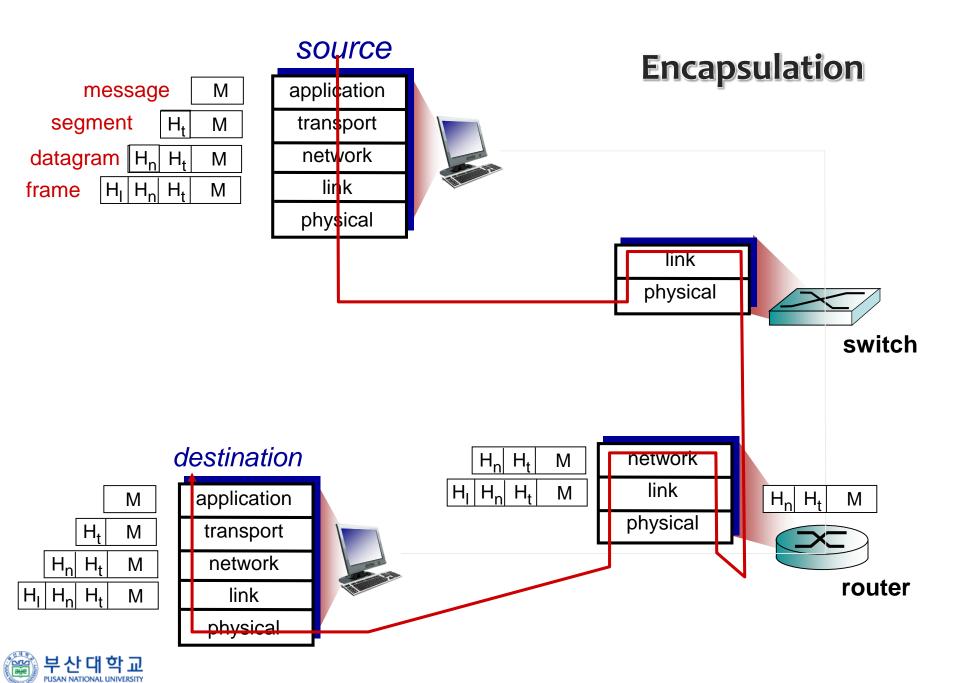

### **Internet Protocol Stack**

- application: supporting network applications
  - FTP, SMTP, HTTP
- transport: process-process data transfer
  - TCP, UDP
- network: routing of datagrams from source to destination
  - IP, routing protocols
- link: data transfer between neighboring network elements
  - Ethernet, 802.11 (WiFi), PPP
- physical: bits "on the wire"

### 02. TRANSPORT-LAYER SERVICES

# Terminologies: Program, Process, and Thread

### Program

- an executable file containing the set of instructions written to perform a specific job
- stored on a disk

### Process

- an executing instance of a program
- resides on the primary memory
- several processes related to same program at the same time

### Thread

the smallest executable unit of a process

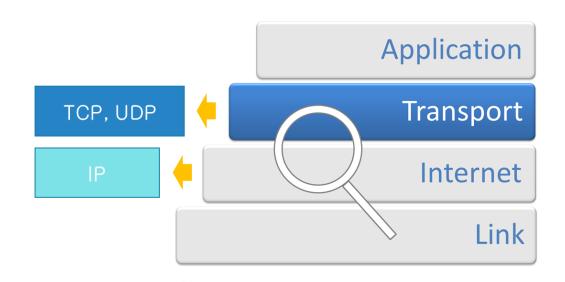

# **Transport Layer Function (1/2)**

### Transport layer

- logical communication between processes
- relies on, enhances, network layer services

### Network layer

 logical communication between hosts

### TCP vs. UDP

### **TCP**

- Transmission Control Protocol
- Reliable, in-order delivery
- Connection-oriented service
  - connection setup
  - error control
  - flow control
  - congestion control

### UDP

- User Datagram Protocol
- Unreliable, unordered delivery
- Connectionless service
  - faster than TCP

# 03. USER DATAGRAM PROTOCOL

# **User Datagram Protocol [RFC 768]**

# "No frills," "bare bones" Internet transport protocol

### **Connectionless service:**

- each UDP segment handled independently of others
- Unreliable: UDP segments may be lost or delivered out-of-order to app

#### **❖** UDP use:

- streaming multimedia apps (loss tolerant, rate sensitive)
- DNS
- SNMP

### \* Reliable transfer over UDP:

- add reliability at application layer
- application-specific error recovery!

# **UDP Segment Header**

32 bits source port # dest port # checksum length application data (payload)

**UDP** segment format

length, in bytes of UDP segment, including header (header plus data)

### Advantages of UDP

- no connection establishment (which can add delay)
- simple: no connection state at sender, receiver
- small header size
- no congestion control: UDP can blast away as fast as desired

# **04. TRANSMISSION CONTROL PROTOCOL**

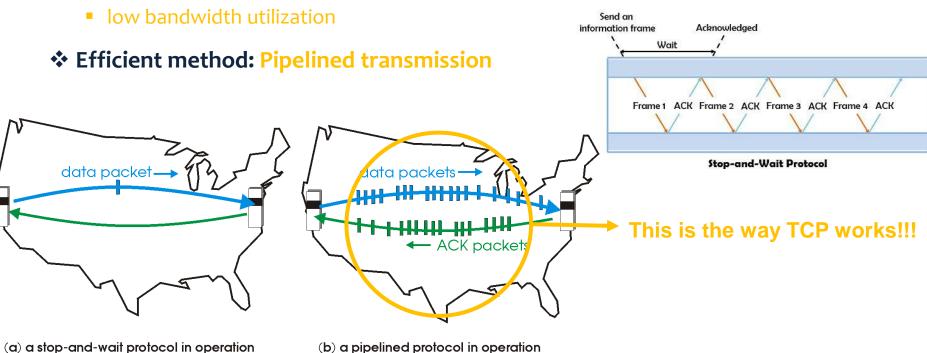

### **TCP Overview**

- ❖ Point-to-point: one sender, one receiver
- **Connection-oriented service** 
  - reliable transfer, in-order delivery
  - handshaking initializes sender and receiver state before data exchange

### **Reliable Transfer**

- **❖** Simple method: Stop-and-wait
  - sender sends one packet, then waits for receiver response
  - after receiving ACK, sender resumes transmission
  - if timer expires without receiving ACK, sender retransmits the previous packet

(b) a pipelined protocol in operation

# **TCP Segment Structure**

32 bits

URG: urgent data (generally not used)

ACK: ACK #

valid

PSH: push data now

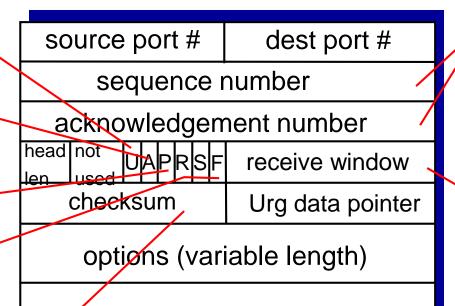

(generally not used)

RST, SYN, FIN: connection estab (setup, teardown commands)

Internet

checksum

(as in UDP)

application data

(variable length)

counting
by bytes
of data
(not segments!)

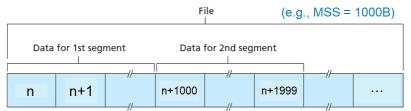

# bytes
rcvr willing
to accept

# Sequence and Acknowledgment Number

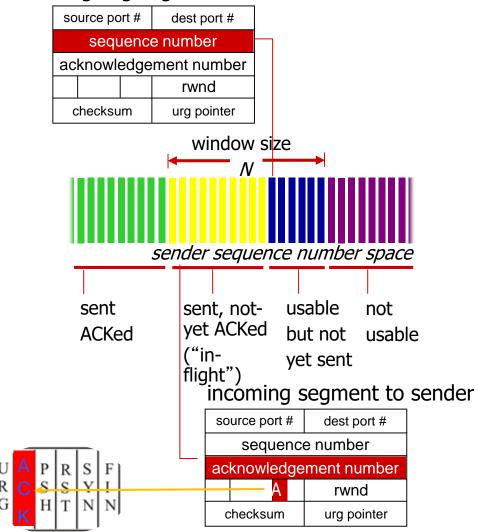

### Sequence number

byte stream "number" of first byte in segment's data

### Acknowledgment number

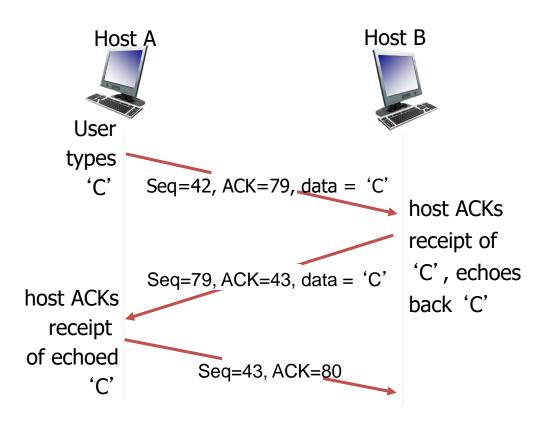

- sequence number of the next segment expected by receiver
- cumulative ACK

outgoing segment from sender

# Usage of Seq. & ACK Numbers

simple telnet scenario

# **Establishing Connection**

### Three-way handshake

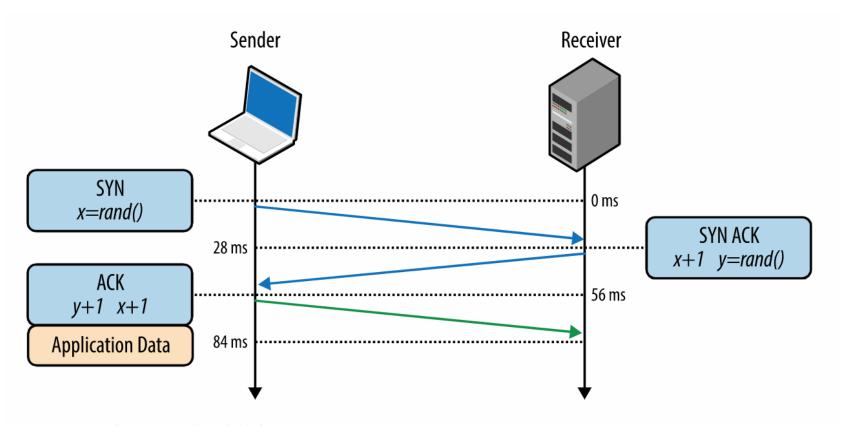

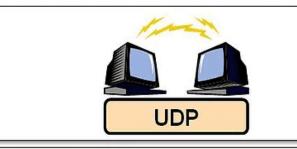

Figure 2-1. Three-way handshake

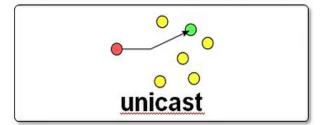

### TCP vs. UDP

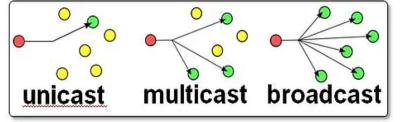

- Slower but reliable transfers
- Typical applications:
  - Email
  - Web browsing

- Fast but nonguaranteed transfers ("best effort")
- Typical applications:
  - VolP
  - Music streaming
